

PSETs Landing Page*

Anish Krishna Lakkapragada

This is the documentation for using my PSET PDFs responsibly. I post these LaTeX'd PSETs (1) as an education resource for friends at other universities, fellow Yalies, and all those interested and (2) for quick reference. These PSETs are not to be used irresponsibly; only look at the solution after giving each problem an honest attempt. **If YOU USE THESE PSETS TO CHEAT, YOU ARE NOT ONLY STUPID BUT YOU ARE CHEATING YOURSELF OUT OF THE ABILITY TO FALL IN LOVE WITH MATH.** Furthermore, I am not smarter than you and my solutions did not always get a perfect score.

The general format for accessing the (one-indexed) `N`th assigned PSET PDF of a Yale course with course number `CODE` is:

`https://anish.lakkapragada.com/notes/TYPE-CODE/psets/N.pdf`

where `TYPE` is `stats` or `math`. Similarly, to access my solution for this PSET you can go to:

`https://anish.lakkapragada.com/notes/TYPE-CODE/sols/N.pdf`

These PSETs and associated solution PDFs are synchronized daily at 4:20AM with my computer files through a Cronjob Shell Script. If you want to contribute any corrections, please email anish.lakkapragada@yale.edu.

*Note that PDF here is referring to Portable Document Format, not to be confused with the veritable Probability Density Function.

Math 226- HW 7 Due: Oc 29 by Midnight

1. An important concern in the study of heat transfer is to determine the steady-state temperature distribution of a thin plate when the temperature around the boundary is known. Assume the plate shown in the figure represents a cross section of a metal beam, with negligible heat flow in the direction perpendicular to the plate. Let T_1, T_2, T_3, T_4 denote the temperatures at the four interior nodes of the mesh in the figure. The temperature at a node is approximately equal to the average of the four nearest nodes- to the left, above, to the right, and below. For instance $T_1 = (40 + 30 + T_3 + T_2)/4$

- (4 points) Write a system of four equations whose solution gives estimates for the temperatures T_1, T_2, T_3, T_4
 - (6 points) Write down the coefficient matrix and find its inverse.
 - (2 points) Use part a) to give the estimated values of T_1, T_2, T_3, T_4 .
2. (6 points) Find a basis of the kernel (that is $N(L_A)$) of the linear mappings given by

$$A = \begin{pmatrix} 3 & 5 & -4 & 2 \\ 2 & 4 & -6 & 3 \\ 11 & 17 & -8 & 4 \end{pmatrix}$$

Use it to describe the solutions to

$$\begin{aligned} 3x_1 + 5x_2 - 4x_3 + 2x_4 &= 0 \\ 2x_1 + 4x_2 - 6x_3 + 3x_4 &= 0 \\ 11x_1 + 17x_2 - 8x_3 + 4x_4 &= 0 \end{aligned}$$

3. (12 points) Find all vectors in a space \mathbb{R}^4 , whose image is equal to the vector $b \in \mathbb{R}^3$ under the linear map $\mathbb{R}^4 \rightarrow \mathbb{R}^3$ given by the matrix A . (That is find the solutions to $A\vec{x} = \vec{b}$). Use these vectors to give a basis to $N(L_A)$.

$$A = \begin{pmatrix} 1 & -3 & -3 & -14 \\ 2 & -6 & -3 & -1 \\ 3 & -9 & -5 & -6 \end{pmatrix}, \quad b = \begin{pmatrix} 8 \\ -5 \\ -4 \end{pmatrix}$$

4. (10 points) Consider the map $T : P_3(\mathbb{R}) \rightarrow \mathbb{R}^4$ such that $T(f) = (f(-2), f(-1), f(1), f(2))$.
- (5 points) Let $\gamma = \{1, x, x^2, x^3\}$, and β be the standard basis for \mathbb{R}^4 . Compute $[T]_{\gamma}^{\beta}$.
 - (5 points) Use $[T]_{\gamma}^{\beta}$ to find a third degree polynomial such that $f(-2) = 1, f(-1) = 3, f(1) = 13, f(2) = 33$.
5. (10 points) Read “An Interpretation of the Reduced Row Echelon Form” from the book (pg 189-194). Then answer the following question

$$V = \{(x_1, x_2, x_3, x_4, x_5) : x_1 - 2x_2 + 3x_3 - x_4 + 2x_5 = 0\}$$

Note that $v = (1, 2, 1, 0, 0)$ is a vector in V . Use column correspondance to find a basis for V that includes v .

Practice Problems

1. Let $T, U : V \rightarrow W$ be linear transformations.
 - a) Prove that $R(U + T) \subseteq R(T) + R(U)$.
 - b) Prove that if W is finite dimensional, then $\text{rank}(T + U) \leq \text{rank}(T) + \text{rank}(U)$
 - c) Deduce that $\text{rank}(A + B) \leq \text{rank}(A) + \text{rank}(B)$ for any $m \times n$ matrix.
2. Let $A = [a_{ji}]_{n \times n}$, $B = [b_{ji}]_{n \times n}$ be matrices. The trace of A is defined by

$$\text{tr}(A) = \sum_{i=1}^n a_{ii}$$

Prove that

- a) $\text{tr}(A + B) = \text{tr}(A) + \text{tr}(B)$
 - b) $\text{tr}(AB) = \text{tr}(BA)$
 - c) Let Q be invertible matrix then $\text{tr}(QAQ^{-1}) = \text{tr}(A)$
