PSETs Landing Page*

Anish Krishna Lakkapragada

This is the documentation for using my PSET PDFs responsibly. I post these LaTEX'd PSETs (1) as an education resource for friends at other universities, fellow Yalies, and all those interested and (2) for quick reference. These PSETs are not to be used irresponsibly; only look at the solution after giving each problem an honest attempt. **If YOU USE THESE PSETS TO CHEAT, YOU ARE NOT ONLY STUPID BUT YOU ARE CHEATING YOURSELF OUT OF THE ABILITY TO FALL IN LOVE WITH MATH.** Furthermore, I am not smarter than you and my solutions did not always get a perfect score.

The general format for accessing the (one-indexed) `N`th assigned PSET PDF of a Yale course with course number `CODE` is:

`https://anish.lakkapragada.com/notes/TYPE-CODE/psets/N.pdf`

where `TYPE` is `stats` or `math`. Similarily, to access my solution for this PSET you can go to:

`https://anish.lakkapragada.com/notes/TYPE-CODE/sols/N.pdf`

These PSETs and associated solution PDFs are synchronized daily at 4:20AM with my computer files through a Cronjob Shell Script. If you want to contribute any corrections, please email `anish.lakkapragada@yale.edu`.

*Note that PDF here is referring to Portable Document Format, not to be confused with the veritable Probability Density Function.

Math 244 - Problem Set 2

due Monday, February 3, 2025, at 11:59pm

Section 1.5

5. Prove the associativity of composing relations: if R, S, T are relations such that $(R \circ S) \circ T$ is well-defined, then $R \circ (S \circ T)$ is also well-defined and equals $(R \circ S) \circ T$.

Section 1.6

3. Prove that a relation R is transitive if and only if $R \circ R \subseteq R$.
6. Describe all relations on a set X that are equivalences and orderings at the same time.

Section 2.1

4. Let $(X, \leq), (Y, \preceq)$ be ordered sets. We say that they are *isomorphic* (meaning that they "look the same" from the point of view of ordering) if there exists a bijection $f : X \to Y$ such that for every $x, y \in X$, we have $x \leq y$ if and only if $f(x) \preceq f(y)$. *Note from Prof. Hall: In the book this problem has four parts, but you are only being asked to do parts (a) and (b).*

   (a) Draw Hasse diagrams for all non-isomorphic 3-element posets.

   (b) Prove that any two n-element linearly ordered sets are isomorphic. *The textbook has a hint to this problem in the back.*

Section 2.2

2. (a) Consider the set $\{1, 2, \ldots n\}$ ordered by the divisibility relation $|$ (see Example 2.1.2). What is the maximum possible number of elements of a set $X \subseteq \{1, 2, \ldots n\}$ that is ordered linearly by the relation $|$ (such a set X is called a *chain*)?

   (b) Solve the same question for the set $2^{\{1,2,\ldots n\}}$ ordered by the relation $\subseteq$ (see Example 2.1.3).

3. (optional bonus problem) Let $\mathrm{le}(X, \preceq)$ denote the number of linear extensions of a partially ordered set $(X, \preceq)$. Prove:

   (a) $\mathrm{le}(X, \preceq) = 1$ if and only if $(X, \preceq)$ is a linear ordering;

   (b) $\mathrm{le}(X, \preceq) \leq n!$, where $n = |X|$ (you may want to read Chapter 3 first).
